

Rocket® Folio Product Family

Powerful indexing capabilities turn unstructured data into an invaluable database of information

Built-in rights management to ensure the right data is seen by the right audience

Unique supercharged content enrichment for increased usability and intelligence

Robust high performance text search allows users to rapidly locate content

Effortless and low cost—a high-value search, content management, and publishing solution

Information is vital to all organizations. Whether you are developing a business strategy, trying to outperform your competitors, determining a pricing methodology, or, perhaps, gathering data for a criminal case, the data you gather and base your decisions on is critical. From handling the exorbitant growth year-over-year, to working with the multiple data-containing file formats, to governing access to sensitive material, one thing is true—the more you depend on data, the more problematic it becomes.

And how you use all this information is just as important. Understanding what others have learned from it—from practical insight to best practice application—and then piecing it all together into a comprehensive and focused view so that you can quickly find, understand, and act on the information, is crucial.

For decades, Rocket has equipped organizations worldwide with a unique solution to address these challenges at a low cost of entry and without professional services. The Rocket® Folio product family provides robust search, content management, and publishing that is accessible via the desktop or delivered on CD/DVD/USB. Rocket® Folio-to-XML and Rocket® NXT are ideal for organizations who want to broaden their reach to end-users who are online or within corporate intranets.

GATHER Various file types are collected and analyzed

INDEX Content is aggregated into a secure, searchable container

DISPLAY Results delivered to devices and automatically formatted

SEARCH Powerful, customizable queries are executed

Real gross domestic product increased at an annual rate of 2.5% in the 2nd quarter of 2013. In the 1st quarter, real GDP increased

2013 gross domestic product

GDP % increases in 2013 | GO!

The first step is to gather and modify content from disparate data sources. You can use structured sources (e.g. databases), semi-structured sources (e.g. XML documents and spreadsheets), and unstructured content (e.g. PDF, Microsoft Powerpoint, and Microsoft Word documents). With Folio, you can interact directly with the content, including PDF files. Enrich your material by adding links to complementary documents, appending content with insightful notes, and highlighting critical details.

The next step is to assemble and index this information into an Infobase (a searchable and secure container), where all content is organized into a structured form for optimized search and navigation that is displayed on your desktop.

Powerful Indexing Turns Unstructured Content into an Invaluable Database of Information

Folio manages the conversion of large volumes of source files into infobase containers, providing complete control over the build process from the first steps of data conversion through the final steps of indexing and compression. Once configured, the steps required to create a final product (involving the conversion, markup, compression, validation, and indexing of your content) can be saved and repeatedly executed with a single command. Updating content is quick and simple.

Built-In Rights Management Supports Both Security and Entitlement Requirements

Our software lets information owners control who can access information, what they can do with it, how long they can use it, and how many concurrent users are allowed. It can also generate passwords that unlock secure or expired data. When necessary, you can drill-down to any level of granularity to meet security needs, all the way to the record level. Data can be distributed to multiple users while preserving control over who can access, edit, annotate, export, search, and print various document subsections; all while encryption technology from RSA Security protects secured information from unauthorized use.

Unique Supercharged Content Enrichment, Including PDF Files

Research has shown that using information, rather than just viewing information, provides higher learning and retention rates. Unique to Folio is the ability to interact directly with the content and provide an overlay of relevant external content, giving end-users greater intelligence on the overall topic at hand. Content developers can add hyperlinks for recommended reading, and add sidebar notes that detail “special instructions,” “internal process relevance” or “watch-out” comments. Additionally, you can add jump links to exact character locations for streamlined and focused guidance throughout the documents, allowing you to connect the dots for you and your readers.

Instant Search

Our software delivers the power to find your search term as quickly as you can type the search word. In most cases, Folio finds the search results before you even finish typing your query. Plus, Folio ranks your search results from most-to-least relevant, letting you make decisions quickly. Powerful search features let you focus your search to words that are within the same paragraph, sentence, or even within a specified distance from each other. You can also search within flexible fields or personal annotations, such as highlighted text and notes. And to create an enhanced end-user experience for your audience, you can create custom search forms that let you leverage sophisticated search features while masking the complexities of advance search syntax.

Effortless, Low Cost, High Value Search, Content Management, and Publishing Solution

Engineered to take the complexity out of information management and search, Folio offloads the heavy lifting with a unique approach to content gathering and indexing with the Infobase architecture. As a self-contained entity, the Infobase provides a wide variety of import filters, flexible automation, advanced security, and rights-management functions. Combine that with the ability to optimize data conversion, indexing and compression, and you’ve got a solution that’s easily implemented and deployed without the support of an entire IT staff, database admins, or expensive professional services.

The Rocket Folio Product Family

❖ **Rocket® Folio Builder: Application for Automating, Gathering and Building Content**

Rocket Folio Builder is for information specialists who organize, update, and maintain collections of information as well as commercial publishers who create professional electronic information titles. An industrial-strength suite of tools, Folio Builder streamlines the process of converting, compiling, and securing information by making it easy to collect information from diverse sources and file formats, combine it into a Rocket Folio infobase, and manage user access rights associated with the information.

❖ **Rocket® Folio Views: Application for Viewing Content/Infobases Available in English, Spanish, French, German, Dutch and Portuguese**

Rocket Folio Views is a high-performance, information retrieval software application designed for professionals who rely on immediate access to information to make decisions. Its primary use is robust, offline text searching within collections of free-format mission-critical information, regardless of size. Folio Views makes you more effective and efficient at finding and providing answers, making decisions, consulting clients, and solving problems using information.

❖ **Rocket® Folio Publisher: Redistributable Version of Folio Views**

Rocket Folio Publisher enables those who want to sell their information electronically to package the Folio Views client software with their information and provides a license for redistribution. Our software also contains sophisticated security to protect a publisher's intellectual property, and supports diverse sales agreements such as subscriptions or site licenses.

❖ **Rocket® Folio Integrator: C++ SDK/API – For Programmers**

Rocket Folio Integrator is a software developer's toolkit that provides powerful technology for using and managing electronic reference information. It lets programmers use familiar development tools to create tailored, integrated, and commerce-enabled information applications. The result is a valuable opportunity for developers to profit from the growing information economy. Folio Integrator provides three types of opportunities for developers: (1) allowing integration of Rocket Folio infobases with other information systems, like relational databases; (2) enabling a deep customization of Rocket Folio Views for specific business needs; and (3) allowing for modular incorporation of one or more components of Folio technology into existing applications.

Expanding Rocket Folio to an Online End-User Community

If you are a content provider looking to leverage your Folio investment and expand your delivery model to the web or across corporate intranets, the Rocket NXT product family is equipped to scale and support your growth.

Rocket Folio-to-XML and the Rocket NXT product family allows you to use your current investment in your Folio production processes—as well as the flexible Folio user interface and powerful editing environment that you've come to depend on—to easily make your content available in online environments.

System Requirements

Supported Operating Systems for the Rocket Folio 4.9 Product Family

This assumes that all operating systems are up-to-date with the most current patches and service packs.

Rocket Folio Product	Operating System	Processor
Rocket Folio Views	Windows XP Home Windows XP Pro Windows 2003 Server Windows Vista Windows 7 Windows 8/Pro/Enterprise	32 or 64-bit
Rocket Folio Builder	Windows XP Pro Windows 2003 Server Windows Vista Windows 7 Windows 8/Pro/Enterprise	32 or 64-bit
Rocket Folio Publisher	Windows XP Pro Windows Vista Windows 7 Windows 8/Pro/Enterprise	32 or 64-bit
Rocket Folio Integrator	Windows XP Pro Windows Vista Windows 7 Windows 8/Pro/Enterprise	32 or 64-bit
