

Rocket® Hot Backup

For Rocket D3 Database Management Systems

Essential Protection Against Business Interruption

Today's business risk environment places an even greater focus on security and protection against business interruptions of any kind. Rocket® D3 Hot Backup system for D3 AIX, Linux, and Windows platforms has been embraced as a failover recovery solution to secure critical business data.

Our Hot Backup can be an integral part of your overall technical strategy for quick data replication and recovery. Learn how easy it is to protect your critical enterprise data. Below are some common questions regarding our backup solution for uninterrupted operation.

Q. Why would I need a solution for uninterrupted operation?

A. Where system failure is a major concern, it is very important to incorporate IT strategies that significantly limit downtime. A Hot Backup solution can dramatically reduce the financial costs involved as well as help protect a company's valuable reputation.

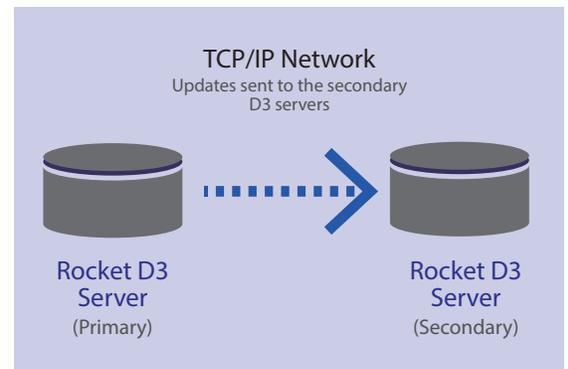

Q. What is Hot Backup?

A. Hot Backup is a D3 software feature. Selected transactions are transferred to the secondary D3 server, which acknowledges and processes the

transactions, maintaining a copy of the database ready to handle the workload should a system failure occur on the primary D3 server.

Q. How does it work?

A. A secondary D3 server is required to be the same specification as the primary D3 server. The Hot Backup secondary D3 server can be in any location where a reliable TCP/IP (an industry standard communications protocol) network connection can be made between the two servers. If the primary D3 server fails, users can be switched immediately to the secondary D3 server, minimizing downtime to just the time it takes to re-establish the users terminal connections on the secondary D3 server.
