

Rocket® LegaSuite Integration

Web API Integration for Enterprise Applications

Connecting SaaS & enterprise applications in the cloud and on-premise

Quickly connect new mobile, web, and middleware applications to existing enterprise assets

Expose mainframe, IBM i, UNIX, and Windows applications as secure Web APIs

Integrate information from applications, transactions, and databases on-premise or in the cloud

ESB Functionality: Supports message routing and transformation and services orchestration

Maintain consistent performance by automatically scaling to meet demand

Deploy inside or outside your organization, on-premise and in cloud environments

Connect Anything to Everything

The The mobile revolution, the big data explosion, and the massive growth of cloud applications have created an enormous number of things to connect. Companies that have figured out how to bring all these things together have a competitive edge.

Rocket® LegaSuite Integration lets you integrate your business-critical applications with any web, mobile, and middleware application that your business needs by turning applications and business logic from enterprise assets into web APIs (REST and SOAP).

Using LegaSuite you avoid having to spend time, money, and resources starting over to recreate business application functions simply because your back-end applications do not natively support web services. It's faster, cheaper, and simpler to leverage your current application investment to enable integration between existing applications and new technologies.

You can quickly create production-grade, scalable web services from back-end applications by using a point-and-click development tool and tie into to critical information in a matter of hours instead of months.

Like a Lightweight ESB

LegaSuite makes it easy to abstract sophisticated enterprise assets into ready-to-use APIs.

You can turn basic transactions into web APIs or go further and orchestrate services from multiple back-end sources into composite services that reach across disparate applications and platforms yet are completely abstracted to users and modern applications.

High-Performance Integration

At runtime, LegaSuite is a high-performing integration platform, with advanced integration capabilities.

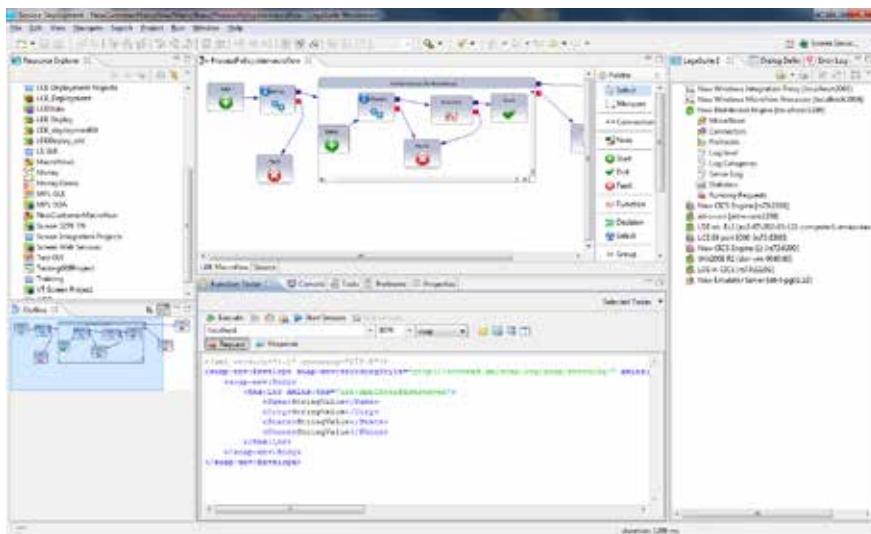

Service Mediation: Separate business logic from a web service definition and call a web service via any format and protocol: SOAP, JSON, XML and HTTP, Sockets, JMS.

Service Orchestration / Composite Services: Combine multiple microflows and orchestrate them into composite services, add additional business logic.

Message Routing and Transformation: Route, transform, and augment messages based on content and rules.

Event Handling: Poll for changes in back-end application and issue event to subscriber

Security: Encryption and signing with ability to authorize, authenticate and audit use of the runtime and protect data in transport.

Deploy On-Premise or Cloud

LegaSuite fits into your existing application infrastructure without adding any additional burden. You can deploy the runtime engine to any on-premise and cloud environment, or any combination in between. Because the engine is a Java based engine it can run on any platform that can support a Java JVM.

Due to the centralized management of security and service governance, you are able to secure your APIs, and so any sensitive data, while still allowing users access to authorized applications.

Quickly and Easily Share Enterprise Applications and Data
