

Rocket® API

Accelerate MultiValue adoption of API- or cloud-first integration

Rocket® API enables businesses running MultiValue (MV) system of record applications to build host application functionality into web and mobile assets for improved employee productivity and customer satisfaction. Unlock valuable data and logic within your MV core applications and create APIs to connect them to the rest of the business without the need to touch underlying legacy code or business logic within your core systems. This allows you to modernize your hosted applications for mobile access, self-service workflows, or cloud-based services. Built-in intelligence ensures that codebase changes do not break the connection between your APIs and the applications that call them.

Benefits/Features

Connect your MV applications to the rest of the business

Rocket API provides intuitive tools that enable you to unlock and leverage valuable data and business logic from host applications in a more connected and holistic way. Improve customer experiences, streamline workflows, and deliver more value to the business from your applications.

Deploy and manage your APIs securely

Rocket API simplifies deployment while retaining clear oversight of modernization development. It includes access to the Automation Hub that provides a central location with tools to help deploy and manage your APIs correctly, secure them with role-based access and separation of duties, optimize performance and monetization, and ensure that high-priority users always have access.

Create APIs without in-house development expertise

Enable development teams to build frontend solutions with modern languages, then connect those solutions to your MV applications and data via APIs without needing to touch legacy code. Attract new talents required to create digital-centric experiences while retaining the stability provided by your core applications.

Improve the customer experience

Converting repetitive, time-consuming tasks like data entry, tracking, and escalation into automated workflows allows customer service representatives to focus on higher-value customer interactions. Leverage automation to provide customer support and services with self-service tools that meet the expectations of today's modern consumers.

What our customers have to say

“We’ve discovered how easy it is, with Rocket, to take repetitive high-volume database queries and put them behind an API microflow. With every endeavor now, we depart legacy green screen processes, and leverage a more modern, efficient, and productive automation process at the front end.”

DON PLATT
Director of IT, Velociti

With Rocket API, you can:

Use it as a “low-code” tool to simplify API creation for your MV applications.

Turn your proven, MultiValue-based systems into modern API-enabled platforms utilizing RESTful services.

Reduce manual steps to transfer data from one system to another.

Manage modernization projects centrally and create separation of duties.

Speed delivery of new competitive capabilities to customers and business users.

Deploy, manage, and secure your APIs to any local, cloud, or hybrid environment.

Modernize with Rocket® API

Empower your MultiValue application to accelerate automation and orchestration of your APIs.
